## HOW TO SHUT DOWN YOUR ALARM SYSTEM

**Step 1.**

Locate the alarm panel (not the code pad). This is usually in the master bedroom wardrobe or a cupboard somewhere, it could be anywhere, behind the fridge, in the garage or in rare cases, in the roof. <span style="color:red">You have to locate this if you want to stop your alarm from going off</span>.

It looks like this - with or without a brand name, could be grey or a different colour.

 .

**Step 2.**

Locate the **plug pack"** that powers the alarm, this is inserted in a power point that is usually nearby and however it could be anywhere in the house. When you find it, turn it off or remove it from the power point.

It looks lake this - with or without a Brand name, may be a different / darker colour.

**Wiggle one or both leads off the battery terminals**

Red Lead

Black Lead

*Step 3.*

Undo the two screws on the front of the panel with a Phillips screwdriver, open the lid (the alarm may go off), if so ignore that and wiggle one or both leads off the battery and the alarm will now be dead.

*Step 4.* Relax and email me if you want your alarm serviced and or repaired.

Regards,
Bob Pearce
