CRITICAL - IMPORTANT NOTICE - PRE-WIRING REQUIREMENTS -

THE FOLLOWING REQUIREMENTS ARE **CRITICAL** TO THE SUCCESSFUL
INSTALLATION OF YOUR ALARM SYSTEM AND OR CCTV SYSTEM

All wires have or will be installed for the alarm and or camera system. All wires will be marked with identity stickers or marks have been placed at appropriate positions on the frame. Device locations are easily identified.

All alarm cables must be pulled into position through the gyprock and cornice by your "gyprock installer" or by your builder. This is very easy for your contractor or builder however your builder may be reluctant to help you with this. External camera cables (if cameras are also being installed) need to be pulled through the outside brickwork or sheeting. This is the same standard requirement as for your electrical power cables for poer points, TV points, network cables etc however it is often no done!

You will have to double check / make sure this happens.

If all wires they are not "pulled through" as required -

- It is possible that your alarm or camera system cannot be installed as designed or additional expenses will be incurred to rectify the problem.

Accordingly, please ensure that your gyprock company and or your builder will "pull through" all alarm wires and or CCTV camera cables in the marked positions.

If there are wires not pulled through, it will result in the technician having to return to finish the installation and or change to wireless alarm devices at an additional cost. If camera cables are not pulled through, cameras may not be able to be installed at that location or new cables have to be installed externally

To avoid additional installation costs, it is vital that the builder has pulled all wires through and a power point is available for connection to the alarm panel / CCTV system.

Yours faithfully,

Robert M Pearce
